US President Donald Trump has repeatedly claimed that the American job market is booming for US-born workers, but available labor data does not fully support that assertion, according to recent economic assessments.

While overall job creation has continued in the United States, economists note that gains have not

been evenly distributed across demographic groups. Employment growth has been shaped by factors such as immigration trends, sector-specific hiring, inflation pressures, and a shift toward service-sector jobs.

Labor data shows participation rates among US-born workers have remained relatively flat in recent periods, while stronger job gains have appeared in sectors that traditionally rely on immigrant labor. Analysts point out that headline job figures reflect total employment growth rather than improvements in job quality, wages, or long-term security.

Wages for many American-born workers have struggled to keep pace with rising living costs, reducing the real impact of employment gains. At the same time, industries including healthcare, hospitality, and construction continue to report labor shortages.

Economists caution that national employment numbers can mask deeper challenges such as underemployment and regional disparities. They stress that labor market performance varies widely by state, age, and education level.

Experts say political claims about job growth should be measured against detailed data to determine who truly benefits, noting that without stronger wage growth and participation, assertions of a booming market remain debatable.
